N/A	NA

Module Title : **Web Application Development**	Module Code: IT1201
Lecturer in charge : **Mrs. Gayana Fernando**	
Assignment Title : **Project Proposal**	
Due Date: **9th September 2024**	Date Submitted: **18th September 2024**
Please Tick here if you have used a proof-reader for this assessment :	
Turnitin Paper ID*	

*Not required if not submitting via Turnitin

Declaration	
I declare that work presented in the assignment submitted to the Sri Lanka Institute of Information Technology is a record of an original work done by myself. This assessment is submitted in the partial fulfilment of the requirement for the award of the degree of Bachelor of Science in Information Technology. The results embodied in this report have not been submitted to any other University or Institution for the award of any degree or diploma. Information derived from the published or unpublished work of others has been acknowledged in the text and a list of references is given.	
Name(s) and Signature(s) :  M.M.M.Shurafa	*Date:* *18th September 2024*

Extension Deadline

Lecturer in charge agrees that the assignment may be submitted ……. days after the deadline and should be marked without penalty.

Lecturer in charge confirmation: …….

1. Introduction and Description of the Project

Project Overview:

The project is an e-commerce web application named **ShoeLand**, which is designed to simplify online shoe shopping for customers and streamline the management of product listings, orders, and users for the administrators. The goal is to develop a system that provides a smooth shopping experience and easy-to-use management tools for the shoe showroom.

This project will help ShoeLand expand its reach to customers who prefer shopping online. With features such as a product display, shopping cart, user registration, and order tracking, customers will be able to browse and purchase shoes from the comfort of their homes. Administrators will have full control over the system's content, including adding new products, managing orders, and keeping the site up-to-date.

1.1 Problem Specification:

At present, ShoeLand operates solely through a physical store, limiting its potential customer base to those who can visit in person. Managing product inventory, handling customer orders, and tracking sales are done manually, which often leads to inefficiencies.

Challenges faced include:

- **Limited accessibility:** Customers must visit the store physically to make a purchase.
- **Time-consuming updates:** Managing stock levels and product details takes extra time when done manually.
- **No online ordering system:** Customers have no way of browsing products or placing orders online.
- **Manual order tracking:** Tracking sales and updating customers about their orders is a manual process, prone to delays and errors.

1.2 Solution Outline:

The solution is to develop a simple, easy-to-use web application that will allow customers to browse the ShoeLand product catalog, place orders, and track their purchases. Administrators will be able to manage products, users, and orders directly through the system, simplifying daily tasks and improving overall efficiency.

The system will consist of two key parts:

- **Customer-facing section:** Includes pages like product display, product details, a shopping cart, user login and registration, and order tracking.
- **Admin section:** Allows administrators to manage products, orders, and users by adding, updating, or removing them.

This system will provide an efficient platform for managing the store and engaging with customers in an easy, streamlined way.

1.3 Key Benefits:

- **Improved Accessibility:** Customers can shop for shoes from anywhere at any time, significantly expanding the showroom's customer base.
- **Automated Processes:** The application automates key tasks such as product management and order tracking, reducing manual work and human error.
- **Customer Convenience:** Shoppers can browse products, add items to their cart, and place orders easily.
- **Easy Management for Admins:** Administrators will have full control over products, orders, and users in one central location, simplifying website management.
- **Faster Order Fulfillment:** With real-time order updates, customers receive quick notifications about the status of their purchases.

2. Details of System Functions

Customer Functions:

Function Name: Product Display

Description: This function allows customers to browse through all the available shoes on the site. They can view details such as product name, price, and available sizes. Customers can click on individual products to see more detailed descriptions and images.

Function Name: Shopping Cart Management

- **Description:** Customers can add shoes to their shopping cart and review the items before making a purchase. They can adjust the quantity of each product, remove items, and proceed to checkout when ready.

Function Name: User Registration & Login

- **Description:** The website provides a simple registration process where customers can create an account with their details. Registered users can log in to manage their profile, view their order history, and track current orders.

Function Name: Order Placement and Tracking

- **Description:** Once the customer has added products to their cart and is ready to purchase, they can proceed to checkout where they will provide shipping and payment information. After placing an order, they can log in to track the status of their order, from processing to delivery.

Admin Functions:

Function Name: Product Management

- **Description:** Administrators can manage the product catalog by adding new shoes, updating existing product details such as prices and stock levels, or removing shoes that are no longer available.

Function Name: Order Management

- **Description:** Admins can review all customer orders, update their status (e.g., shipped, delivered), and manage returns or cancellations. This ensures customers stay informed about their order status.

Function Name: User Management

- **Description:** Admins have access to a list of registered users and can manage their accounts by resetting passwords, updating details, or deactivating accounts as needed.

Function Name: FAQ Management

- **Description:** The system allows administrators to manage the Frequently Asked Questions section of the website. They can add, update, or remove FAQs to provide useful information to customers.
